Amendments to the Claims:

Please cancel claims 12 and 14-19 without prejudice or disclaimer.

The following listing of the claims replaces and supersedes all previous listings.

1. (Currently Amended) A method Method for producing a layer compound (6)

with at least two security features disposed in register to each other, comprising the

following steps:

providing a first carrier foil (100) with at least one first security feature and

first register marks,

- providing a second carrier foil (200) with at least one second security

feature and second register marks,

- joining the first carrier foil to the second carrier foil, at least one of the two

carrier foils being under tensile stress and at least one of the second or the first carrier

foil being controlled in longitudinal direction and transverse direction with the help of the

first and second register marks in such a way, that a layer compound is the result, in

which the first and second security features are disposed in register to each other,

whereas the controlling of at least one of the second carrier foil (200) or the first carrier

foil (100) is effected by stretching the carrier foil in longitudinal direction of the carrier

foil.

2. (Cancelled)

- 3. (Currently Amended) The method Method according to claim 1, characterized in that wherein the second carrier foil (200) is shorter than the first carrier foil (100) and is stretched relative to the first carrier foil (100).
- 4. (Currently Amended) The method Method according to claim 1, characterized in that wherein the first carrier foil (100) due to the tensile stress undergoes a constant stretching in longitudinal direction of the carrier foil and the second carrier foil (200) is stretched relative to the stretching of first carrier foil (100).
- 5. (Currently Amended) The method Method according to claim 1, characterized in that wherein the carrier foils (100, 200) are provided on rollers (3, 4) and are drawn off the rollers, the stretching of at least one of the first &or and second carrier foil (100 or 200) in longitudinal direction of the carrier foil being achieved by a controlled slow down of this roller when drawing off the carrier foil from the respective roller.
- 6. (Currently Amended) The method Method according to claim 1, characterized in that wherein a registered joining of the two carrier foils (100, 200) with respect to their longitudinal edges is achieved by means of a tension group (11).

7. (Currently Amended) The method Method according to claim 1, characterized in that wherein the tension group is controlled with the help of the first and second register marks.

- 8. (Currently Amended) The method Method according to claim 1, characterized in that wherein the register marks are read by means of light guides or CCD-cameras.
- 9. (Currently Amended) The method Method according to claim 1, eharacterized in that wherein the security features are used as register marks.
- 10. (Currently Amended) The method Method according to claim 1, eharacterized in that wherein the layer compound is divided into so-called endless threads or endless strips.
- 11. (Currently Amended) A method Method for producing a security element comprising the procedure steps according to claim 1, characterized in that—wherein from the layer compound (6) a security element with its final transverse and longitudinal dimensions is divided out.
